The Artificial Intelligence Timeline

- ChatGPT was used to generate information
- Canva was used for the visual display

ARTIFICIAL INTELLIGENCE TIMELINE

Artificial Intelligence is a field that seeks to create machines that can simulate human intelligence-thus the capability to make meaning out of the world around us.

1950s

- Alan Turing publishes “Computing Machinery and Intelligence”, introducing the Turing Test.

1960s

- First industrial robot, **Unimate**, used in a GM factory
- ELIZA, an early natural language processing chatbot, is developed.

1970s

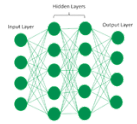
- AI research overpromised and underdelivered; funding cuts followed.

1980s

- Second AI Winter due to the collapse of **Expert systems** market and limited computing power.

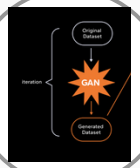
1990s

- Emergence of statistical machine learning methods (e.g., SVMs, decision trees)



2000s

- Geoffrey Hinton popularizes deep learning.



2010s

- Generative Adversarial Networks (GANs) introduced.

2020s

- OpenAI releases GPT-3, a massive language model

Future

- General AI (AGI) development
